# ABSTRACT

Indian consumers are more health-conscious, preferring safe, natural, organic, and herbal items, particularly in personal care and cosmetics. Its popularity and demand are growing every year. Herbs are becoming increasingly popular in the personal care product segment. The growing demand for herbal products begun with the launch of Patanjali products in 2016. It also affected the sales of other conventional products. Other companies and multinational corporations have also started launching herbal and natural products. The aim of this study is to analyze and understand the behavioural differences between rural and urban consumers to develop a marketing plan for herbal products. About 150 people in Namakkal district were surveyed about their awareness and preferences as well as their consumption and satisfaction with branded herbal personal care

products. According to the study's findings, Himalaya Herbals have a high degree of awareness in both rural and urban consumer and it was clear that brand image and health consciousness were the most important influencing factors for rural and urban consumers, respectively.

Keywords: Herbal personal care products; FMCG; awareness level; factors influencing; problems.

# 1. INTRODUCTION

India is a diverse economy with a healthy balance of rural and urban markets. The urban sector earns about 55 per cent, while the rural sector earns 45 per cent. FMCG has a unique position in both the urban and rural markets. Fast Moving Consumer Goods (FMCG) is India's fourth-largest industry (FMCG). Fast Moving Consumer Goods are low-cost items that require little shopping efforts. These are packed nondurable products. These products are purchased in small quantities and on a regular basis by the end-user [1]. Today, everyone relies on Fast-Moving Consumer Goods companies (FMCG) to provide products that meet our basic needs [2]. Every family's monthly budget includes a significant purchase price for FMCG. For example, household and personal care products account for 50% of the sales in the industry, healthcare accounts for 31-32% and food and beverage accounts for the remaining 18–19% [3]. Due to the introduction of sachets, rural residents who generally avoid large-scale purchases began to buy branded FMCG items like Rs.1shampoos from rural stores. As a result, rural consumers now prefer branded goods over traditional brands. The FMCG sector is important to the Indian economy since it touches every aspect of people's lives.

Natural, organic, and herbal products are becoming increasingly popular among Indian customers [4]. Rural consumers prefer the above said products, and the growth rate of it in rural areas is higher than in urban markets [5]. Herbal products are botanical nutritional ingredients produced from plant sources that are primarily used to maintain or improve health. People nowadays are turning to "safe" and Ayurvedic medicines such as the Himalayas, Biotique, Dabur, Lotus, Patanjali, and others as they become aware of the potential dangers of chemical reactions to existing products.

The Indian Personal Care Products market is therefore driven by a change in consumer preferences in personal care products with herbs rather than artificial chemical products due to increased awareness of various products. In terms of holistic personal care products, herbal personal care products are now counted as a major component. According to the report of FMCG industry (by IBEF) Indian Personal Care Market was valued at USD 4.72 Billion in 2020 and is projected to reach USD 7.98 Billion by 2028, growing at a CAGR of 6.1% from 2021 to 2028.

Customers are becoming more health-conscious, preferring herbal items. People are looking for herbal ingredients, particularly in personal care products. Companies should focus on consumer demand and provide distinctive products for both rural and urban customers.so therefore this study would focus on brand awareness and factors influencing branded herbal products among rural and urban consumers.

# 2. RESEARCH STRUCTURE

The remainder of this paper is organised as follows: The next primary section presents previous studies connected to this study, followed by objective, methods, results, and closes with a conclusion.

#### **3. REVIEW OF LITERATURE**

Gurung [6] investigated brand awareness of fastmoving consumer items and determined that people are more conscious of established brands than new ones. Furthermore, it was proposed that new companies develop some strategies and use social media marketing to familiarise their products with customers. Sundari and Murugan [7]. The study revealed that both primary and secondary factors were closely related to every consumer's choice of purchases. Price, quality, and quantity are the 3 primary benefits. However, the product's ingredients, function, unique characteristics, manufacturer's reputation, and product certification are some of the secondary benefits. Quality is the most important factor affecting male consumers' purchasing decisions. They typically purchase cosmetics from a single store convenience (Kumar & Prakash, 2007). Green trust and green brand preference can somewhat moderate the relationship between green awareness and

purchasing intention green brand areen preference had a greater indirect effect on purchase intention than green trust [8]. According to the findings of Susilowati and Sari [9], there is a significant positive relationship between brand awareness, brand association, and perceived quality and brand loyalty and purchasing intention. However, there is no apparent link between brand loyalty and brand purchasing intention [10]. The knowledge about organic PCP and sensory appeal increased the utilitarian and hedonic attitudes for these items. Natural content features and quality perception influence utilitarian mindset positively in context. Finally, both the affective and functional attitudinal components enhanced purchase intention significantly [11].

# 3.1 Objective of the Study

The main objective of the study is to determine the level of consumers brand awareness and factors influencing the purchase of herbal personal care products available under Fast-Moving Consumer Goods (FMCG) brands among rural and urban consumers.

### 4. RESEARCH METHODOLOGY

The study's approach is based on both primary and secondary data. But the research mostly depends on primary data obtained through a structured interview schedule. The secondary data is gathered from books, reports, periodicals, magazines, articles, and websites.

For this study Namakkal district's rural and urban areas were specifically chosen. Because the majority of relevant research has been undertaken in developed regions like as Chennai and Coimbatore.

Convenience sampling, a non-probability sampling methodology, was chosen as the sampling method. because of cost effectiveness, speed, ease of use, and readily available data. The sample size was around 150, and it included respondents from 7 different taluks in the Namakkal district. Of those, 75 were from the revenue villages and 75 from the town. The study was conducted during April 2022 to June 2022.

The tools used in this study were percentage analysis and the relative importance index. Demographic characteristics and awareness level were determined by using percentage analysis. The relative importance index was used to assess the factors influencing the purchase. So that 9 questions were scored on a 5-point Likert scale. Weightage was assigned so that strongly agreeing carries 5 points and strongly disagreeing carries 1 point.

RII was calculated using the following equation.

$$\mathsf{RII} = \frac{5\mathsf{N}1 + 4\mathsf{N}2 + 3\mathsf{N}3 + 2\mathsf{N}4 + 1\mathsf{N}5}{\mathsf{A}\,\mathsf{X}\,\mathsf{N}}$$

 $N_1$  - Number of respondents for Strongly Agree  $N_2$  - Number of respondents for Agree  $N_3$  - Number of respondents for Neutral  $N_4$ - Number of respondents for Disagree  $N_5$  - Number of respondents for Strongly Disagree A (Highest weight) = 5 N (Total No. of respondents) = 75

# 5. RESULTS AND DISCUSSION

Table 1 showed that demographic The characteristics of respondent customers. In this study female respondents (51 per cent) exceeded male respondents in rural areas, and female respondents (64 per cent) exceeded male respondents in urban areas. The study found that the majority of these people (46.66 per cent in rural areas and 58.66 per cent in urban areas) were between the ages of 21 and 30. In terms of marital status, married respondents were higher compared to unmarried respondents in both situations. Similarly, joint families were less common than nuclear families. Rural had medium family sizes than other categories (53.33 per cent), whereas urban respondent had small family size (50.66 per cent), In terms of occupation, the majority of respondents (26.66 per cent) were house wife, followed by private employees (22.66 per cent) among rural respondents, while 33.33 per cent were students among urban respondents. The majority of respondents (53.33 per cent and 66.66 per cent, respectively) were graduates, in both rural and urban areas. The majority of respondents in both rural and urban areas belonged to the lower middle-income category (56.00 per cent and 41.33 per cent, respectively).

From the Table 2, An Average awareness level of branded herbal personal care products among rural and urban respondents were 69 per cent and 79 per cent respectively. Himalaya Herbals had a high level of awareness (93 per cent and 95 per cent) in rural and urban respectively, while Lotus Herbals had a low level of awareness 27 per cent in rural and 44 per cent in urban.

# 6. CONCLUSION

Brand awareness and brand acceptance are important element that FMCG firms can concentrate to increase their market share in herbal products. Among the existing competition in the industry, Patanjali and other branded products now herbal facing significant competition from Himalaya herbals. The urban market is almost reached stagnant level with increasing competition, hence companies that operate in urban areas should expand into rural areas in order to grow and sustain their businesses. FMCG companies can benefit enormously from changes to the marketing mix elements for herbal personal care products that are attractive to and suitable for the rural market. They should simultaneously implement various urban marketing strategies for urban consumers. The FMCG brand participants can use this study to better understand how the behaviour of rural and urban consumers differs. FMCG brands

make a big contribution to understanding how people differ based on exposure and preference levels. This study will benefit future research on herbal FMCG products.

# FINDINGS

- The total average awareness of brands of herbal personal care products was 50.7 in the rural respondent and 57.7 in the urban respondent. In both cases, Himalaya Herbals had the highest level of brand awareness, followed by Patanjali.
- Brand image and peers group influence were the most important influencing factor for the purchase of herbal personal care products among rural consumers. Health consciousness and natural/ herbal ingredients were the most important influencing factor for urban consumers.

# **COMPETING INTERESTS**

Authors have declared that they have no known competing financial interests or non-financial interests or personal relationships that could have appeared to influence the work reported in this paper.
